Security Scan

Swimming with sharks?

Scary stuff, or is it?

In one month we measured over 1000 separate attacks against the Globis corporate web server. This is not unusual for a business using the Internet.

The business consequences of a successful attack can be very serious. However, attacks will happen if you are on the Internet, the question is: are you prepared? The Globis Security Scan will ensure that you are.

How much security do I need?

Whether you are a government agency or a small web retailer, security is always a compromise between cost, functionality and safety.

The Globis Security Scan finds problems, reviews policy, and helps you decide how much security you need, and where you need it.

It does this at a price that is affordable and fixed, and with a realistic timescale based on your requirements and deadlines.

Globis Security Scans are structured as follows:

Service Scan

Service Scan checks the security of new or existing applications. We look at the business objective of the service, where the users are, and how the application works. We scan the servers for vulnerabilities, and review management policy.

System Scan

This checks the security of components for a larger system such as servers, firewalls, routers etc. A detailed review of relevant policies and procedures is also carried out.

Corporate Scan

This is a major corporate "health check" covering all aspects of an organisation's information security management.
It allows policies to be defined, and management procedures to be reviewed by IT directors. It is invaluable preparation for a BS7799 audit or an equivalent certification of all or part of the organisation.

Globis

CONSULTING

Pie chart:
- Human Error: 35%
- Human omission: 25%
- Disgruntled employees: 15%
- External people: 10%
- Fire: 7%
- Flood: 5%
- Other natural disasters: 3%

A proven methodology

Globis Security Scans are carried out by proven consultants with the relevant professional expertise and multi-national experience. The consultant is dedicated to you throughout the scan, presents the findings, and answers any questions regarding the recommendations.

The Scans are based on the industry standard best practice described in BS7799, in combination with many years of experience working with international companies, banks and governmental organisations.

Why Globis?

Many companies carry out security scans, but most only focus on the technical aspects. We believe that where security is concerned you must consider everything. Only 10% of attacks actually come from external hackers, and many hazards are often overlooked.

The Globis Security Scan gives an independent and expert view of the risks to your IT infrastructure. We look at all aspects; hardware, software, policy and implementation.

This ensures you get real value from your security budget by targeting it where it will have the biggest impact.

Importantly, we are not bound by commercial ties to any particular IT service or equipment providers. Globis can also help you implement recommendations and run projects should you so wish.

Deliverables

- Copies of the client interview notes.
- A presentation of the results and conclusions on the client premises.
- A hard copy report of the detailed findings and recommendations.
- A CD containing all data.

Application Lifecycle Support

The Security Scan is one of the Globis Application Lifecycle Support suite of services. These services have been developed to improve the overall design, delivery, and operational quality of any corporate application.

They are equally effective as a stand alone service, or when employed as a complete suite covering the full lifecycle of an application.
